

There are several features on each of the webpages. One feature that is on every page is that there is a nav bar that connects all the pages together. Each page also has additional features on them. For example, on the home page, when you first open the page, you get a pop up asking what your name is. If you input anything, the top right will change to “Welcome back, Your Name!”. If you don’t input anything and just click the ok button, the top right will say Guest instead. Another example is that on the home page, there are some basic cards giving a little bit of info on each page.

On the about page, it looks quite empty at first. I did not have time to add extra things to it, so it was full even before you used the main functionality of it. On the page though, you will notice that there are several underlined words that you can click on. Clicking on them reveals the information the clicked on words described. For example, “Who I am” gives information about me. Under the one labeled “Favorite Games”, there is additional functionality of being able to click through several images. If you click on the image, it switches to the next one on the list and when it reaches the end, it will go back to the start of the list. One more feature of the About page is that you can also click on the already revealed sections to hide them again.

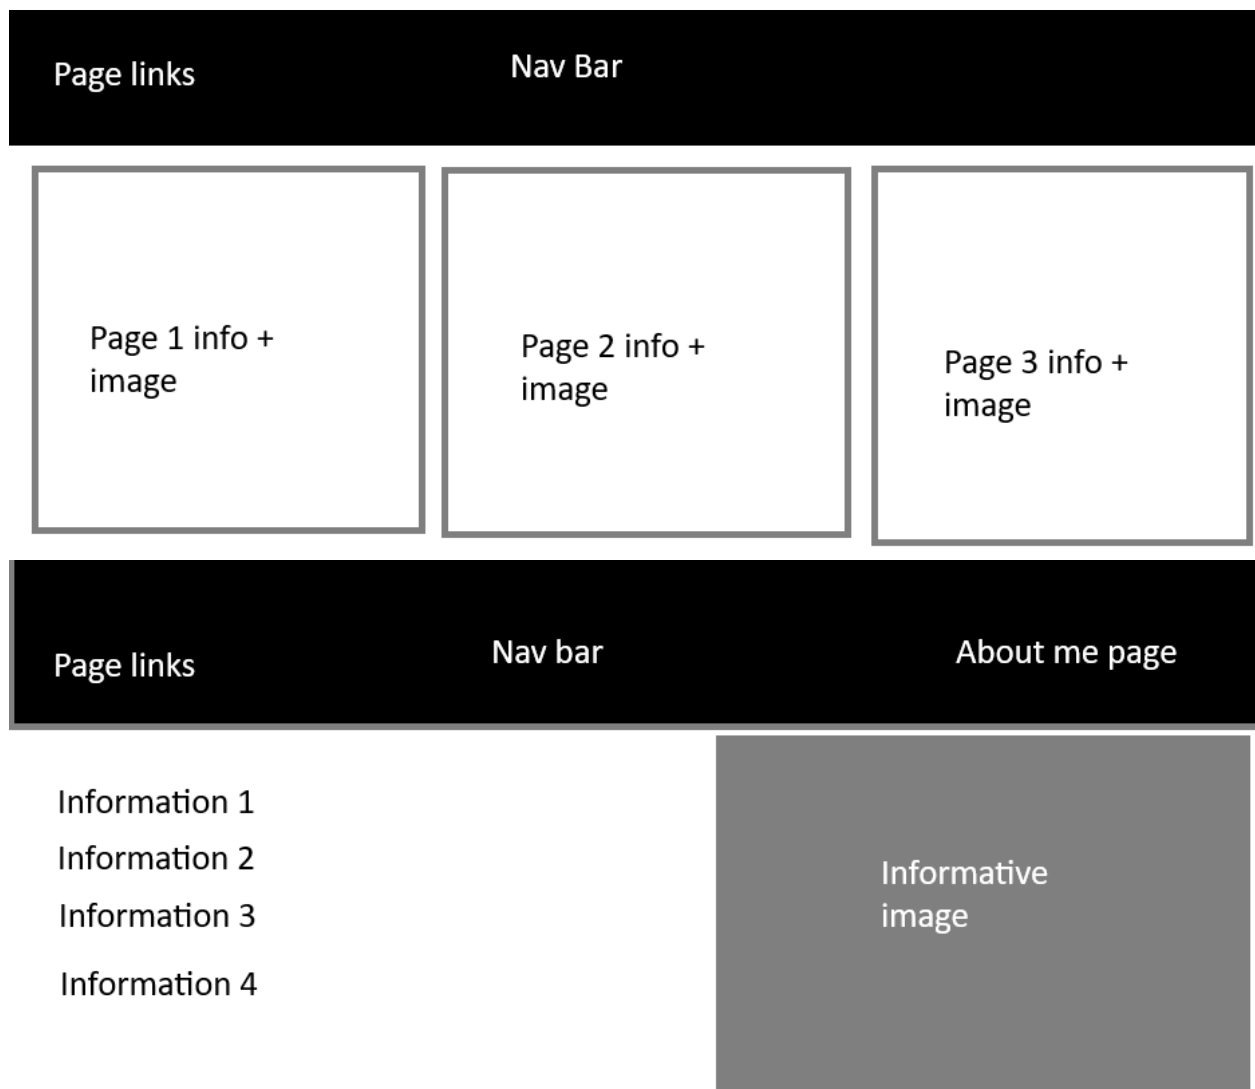

The contact page is extremely simple; it has a form that you can fill out and send. On the form, you can enter a name, your email, and the message you’re sending. As you are filling it out, if you try sending it without putting a name, it doesn’t send and tells you to input a name. The email section of the form checks if it has an @ symbol in it, and the message section checks whether the message has at least 5 characters in it. Once all those requirements are met, clicking on send, will “send” the message. All that really does is clear the form and change the information at the bottom. It does not actually send anything to me.

On the games page, you will be met with a list of games I pulled from my recently played games on Steam. Each one has a card of sorts that shows the game's title image, the name of the game, and the number of hours I have spent playing that game. There are only 12 games on the list for now, but it is easy to add more to it. Above the cards for the games, there are two drop down menus that allow you to filter or sort the games. One allows you to filter to specific genres of games, while the other one allows you to sort by hours I’ve played. The sorting by hours also allows you to sort from low to high or high to low.

Working on this project helped me realize that if i want to become more available for people to see my work, I will need to make a page for people to find my stuff on whether its programming is related or not. Because of that I am planning on possibly improving this site and hopefully making it a real online site instead of local. Some of my plans would be

to improve the webpages' appearance as well as functionality. For example, I would like to make the home page cleaner looking than it is as well as improve the information it gives. I would also like to add more content to the about page and change the way the contact page works. One other change I would like to make is sometime adding my entire steam library to the list of games so that I can use it as a sort of tracker for myself. There are other pages I would like to include as well, such as a page to showcase my work such as webpage things, game design, or videos and streams.

Sketches for what I wanted: (Used paint)
